THE WORLD'S ELECTRICITY IN 2025

42.6%

of it came from low-carbon sources: wind, solar, hydro, nuclear and bioenergy

up from 35.3 % in 2000

Clean power grew faster than demand, and fossil generation fell

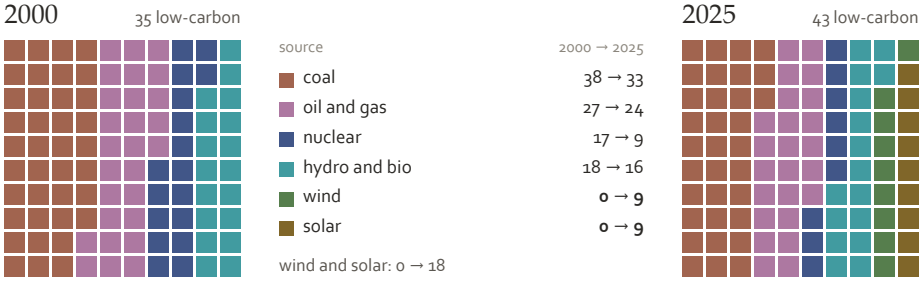

+883
TWh more from low-carbon sources than in 2024

−41
TWh from fossil fuels, while demand rose 842 TWh

11×
solar since 2015; in 2025 it passed wind

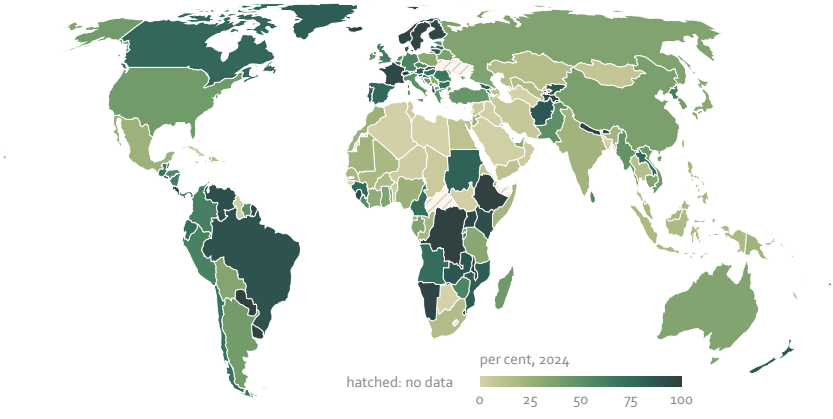

Where every 100 units came from

each square is 1 % of world generation, by source

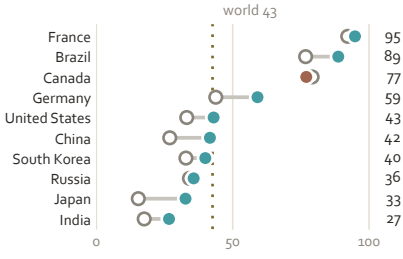

77 of 195 countries got over half their power from low-carbon sources

low-carbon share of electricity by country, 2024

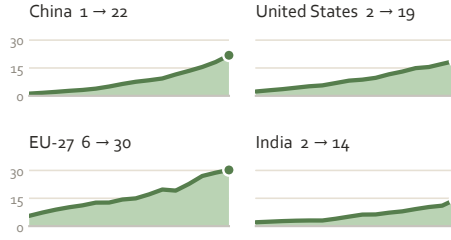

The ten largest producers

low-carbon share, %, 2015 ○ and 2025 ●

Wind and solar

share of generation, 2010–2025, %

Each kilowatt-hour now carries 458 g of CO_2, against 527 g in 2000.
