Faster growth drives a population through period doubling into chaos

Ricker map $N_{t+1} = N_t\, e^{r(1-N_t)}$ · the steady state gives way at $r = 2$, and the Lyapunov exponent turns positive at $r = 2.69$

model after Ricker (1954) and May (1976); iterated in prepare_data.py · tikz_ricker.tex · git a3ce420
